# Water Utility Rate Study Final

Final Draft Report

July 8, 2025

July 8, 2025

Ms. Sarah Talbert Assistant Director of Utilities City of Columbia 701 E. Broadway Columbia, MO 65205

Re: Water Utility Rate Study Final

Dear Ms. Talbert,

Stantec Consulting Services Inc. is pleased to present this Final Draft Report of the Water Utility Rate Study Final that Stantec performed for the City of Columbia, Missouri. Stantec appreciates the fine assistance provided by you and all the members of City staff who participated in the study. Please feel free to distribute this report to the appropriate individuals at the City for their review, in addition to your own.

If you or others at the City have any questions, please do not hesitate to contact me. Stantec appreciates the opportunity to be of service to the City and look forward to working with you again in the near future.

Sincerely,

Kyle Stevens Principal (813) 269-6036 kyle.stevens@stantec.com

# 1. INTRODUCTION

Stantec Consulting Services, Inc. (Stantec) is pleased to present the results of the Water Utility Rate Study Final ("Study") that Stantec completed for the Water Enterprise Fund ("Utility") of the City of Columbia, Missouri ("City"). This report presents an overview of the key issues, results, and recommendations of the Study. Detailed schedules of the analyses are presented in the appendices of this report.

# 1.1 BACKGROUND

In 2018, the City and its consultant at the time completed a Water Utility Rate Study that established much of the current rate and fee structures and identified a five-year plan of rate adjustments to fund the Utility's financial requirements. At that point in time, it was recommended that the Utility perform 5% annual rate revenue adjustments from FY 2018 through FY 2023. The City has retained Stantec to perform a comprehensive evaluation of its current water rates and fee structures and to measure the adequacy of revenue such that they satisfy the upcoming financial requirements of the Utility, as well as the specific objectives below.

# **1.2 OBJECTIVES**

The principal objectives of this Study, as defined in the scope of work, include the following:

**Revenue Sufficiency Analysis** – Develop a multi-year rate plan of water rate revenue increases that will satisfy the Utility's projected annual operating, debt service, and capital cost requirements as well as reach and maintain adequate reserve levels over the projection period.

**Cost Allocation** – Allocate test year (FY 2026) revenue requirements to the base plus extra capacity method as outlined in American Water Works Association's (AWWA) M1: Principles of Water Rates, Fees and Charges.

**Rate Design** – Review the City's existing rate structure and develop modifications, as appropriate, to reflect the proportional recovery of system costs by fixed and volumetric charges as well as alignment with costof-service findings. In addition, water bill affordability, efficiency programs. and specific customer policies were reviewed.

**Water Equity Fee** – Calculate the estimated cost of the City's existing major supply, treatment and distribution system components, adjusting for outstanding principal payments on debt, and utilize current and future capacity data to determine an updated schedule of water equity fees by meter size.

**Miscellaneous Service Charges Review** – Provide a cost template and review City staff's identified costs for the Utility to provide various miscellaneous services (such as service initiation fees, meter fees, service disconnect/reconnect fees, tap fees and others) to serve as the basis for adjustment to these types of charges to comport with cost.

# 2. REVENUE SUFFICIENCY ANALYSIS

This section presents the financial management plan and corresponding plan of water rate revenue adjustments developed in the RSA that was conducted as part of the Study. The following subsections present the source data, assumptions, results, conclusions, and recommendations of the financial plan developed for the Utility during the Study, while Appendix A includes detailed supporting schedules for the financial management plan identified herein.

During the RSA, Stantec reviewed the financial management plan and developed a corresponding water rate revenue adjustment plan through interactive work sessions with City staff for a ten-year projection period of FY 2025<sup>1</sup> – FY 2035. During these work sessions, Stantec examined the impact of various inputs or assumptions upon key financial indicators by using our proprietary Financial Analysis and Management System (FAMS) model. Stantec developed the plan of annual water rate revenue adjustments presented in this report that will allow the Utility to fund its cost requirements throughout the projection period and meet its financial performance targets.

To initiate the RSA, Stantec obtained the City's historical and budgeted financial information regarding the operation of the Utility. Stantec also obtained the Utility's multi-year CIP, including annual renewal and replacement requirements. Stantec documented the Utility's current debt service obligations and covenants, or promises made to lenders, relative to net income coverage requirements, reserves, etc. Stantec also discussed with City staff other assumptions or policies that would affect the financial performance of the Utility, such as billed volumes and customer growth, debt coverage targets, levels of operating reserves, interest earnings, and escalation rates for operating costs.

This information was entered into the FAMS model which produced a ten-year projection of the sufficiency of the Utility's revenues to meet all of its current and projected financial requirements. Stantec determined the level of rate revenue increases necessary in each year of the projection period to provide sufficient revenues to fund all of the Utility's cost requirements.

# 2.1 SOURCE DATA

The following subsections present the key source data relied upon in the development of the revenue sufficiency analysis presented herein.

<sup>&</sup>lt;sup>1</sup> The RSA begins with FY 2025 data upon which future projections in the ten-year projection period are based.

## 2.1.1 Beginning Fund Balances

The statement of net position within the FY 2024 ACFR provided by City staff was used to establish the beginning FY 2025 balances for the water utility fund.

#### 2.1.2 Revenues

The revenue for the Utility consists of base rate revenue, volumetric rate revenue, interest earnings, and revenue from various miscellaneous service charges. The basis of future revenue projections in this Study for each of the various revenue types are as follows:

- Base and volumetric rate revenues are based upon the FY 2025 Adopted Budget and detailed 2024 billing data, adjusted annually to reflect the impact of assumed rate increases, growth, and changes in billed use by account.
- Water Equity Fee revenue was calculated using the assumed growth in new connections charged at the current connection fee of \$576 per 5/8" connection.
- Interest earnings are calculated annually based upon projected average fund balances at an assumed interest rate of 3.00% from FY 2025 – FY 2035.
- Miscellaneous revenues are based upon the FY 2025 Adopted Budget or adjusted from staff's input to reflect expected annual revenue for the projection period.

## 2.1.3 Operating Expenditures

The FY 2025 operating expenditure requirements reflect the FY 2025 Adopted Budget and include personnel, operating and maintenance, and minor capital outlay expenses. Starting in FY 2026 through FY 2035, the individual expense accounts are escalated annually based on specific cost escalation categories that were reviewed with City staff. In addition, the City's PILOT expense reflects one of the largest single line operating expenditures of the water utility, this was projected based on the gross receipts and property tax formula used by the City into future years. Schedule 5 of appendix 1 of the appendix provides detailed assumptions and calculation of the PILOT for year.

## 2.1.4 Debt Service Payments

Outstanding debt service payments were provided for the City's current revenue bonds. Schedule 4 of Appendix A includes debt service payments by debt obligation for the projection period. Current debt includes the 2014A (Refunded 2003A & 2004A), 2015A (Refunded 2005A), 2019A, 2019B and 2023A.

### 2.1.5 Capital Improvement Program

The CIP was provided by City staff for FY 2025 to FY 2035 and totals approximately \$90.3 million in current day dollars. The CIP is comprised of a detailed list of individual projects with costs by fiscal year and is included on Schedule 7 of Appendix A in this report.

## 2.2 ASSUMPTIONS

The following presents the key assumptions of the RSA.

## 2.2.1 Cost Escalation

Annual cost escalation factors for the various types of operating and maintenance expenses were developed based upon discussions with City staff, a review of historical trends, and Stantec's industry experience. Expenditures for the projection period reflect the FY 2025 Adopted Budget escalated annually at an assumed cost inflation factor specific to each expense account. The specific escalation factors assumed for the various categories of expenses can be found on Schedule 6 of Appendix A.

## 2.2.2 Customer Growth and Volume Forecast

New accounts and volume projections were based upon a review of historical data, observations of current environmental and economic conditions, discussions with City staff regarding the anticipated number of new service connections to the Utility, and trends in demand.

The analysis assumes approximately 0.68% growth in total water accounts, equating to approximately 338 accounts annually during the projection period. Usage assumptions were kept flat for residential, master meter, large commercial, and airport customers based on historical usage trends, while commercial accounts usage is growing by 0.7% in usage per account throughout the projection period. Account growth and usage assumptions have been projected based on City staff input. Schedule 1 of Appendix A presents the growth and usage assumptions for all water accounts.

## 2.2.3 Debt Service Coverage

The debt service coverage requirement in the Utility's outstanding bond covenants is net income of at least 1.10 times annual debt service requirements. Net income is calculated as revenue minus operating expenses.

As a policy decision, utilities often measure revenue sufficiency and set rates that allow for revenue recovery to meet a specific debt service coverage factor above the minimum to ensure that debt service payments can be made in unforeseen circumstances (this could be due to variability in usage, unanticipated capital requirements or operating cost increases, natural disasters, etc.). As such, the financial management plan presented herein reflects a target debt service coverage factor, or ratio of net income to annual debt service, of 1.25 times debt service during the projection period.

City of Columbia | Water Utility Rate Study Final Draft Report

## 2.2.4 Minimum Reserve Policy

Reserve balances for utility systems are funds set aside for a specific cash flow requirement, financial need, project, task, or legal covenant. These balances are maintained to meet short-term cash flow requirements and, at the same time, minimize the risk associated with meeting financial obligations and continued operational and capital needs under adverse conditions. The level of reserves maintained by a utility is an important component and consideration for developing a multi-year financial management plan.

Many utilities, rating agencies, and the investment community place a significant emphasis on having sufficient reserves available for adverse conditions. The rationale related to the maintenance of adequate reserves is twofold. First, reserves help to assure a utility that it will have adequate funds available to meet its financial obligations during unusual periods (i.e., when revenues are unusually low and/or expenditures are unusually high). Second, it provides funds that can be used for emergency repairs or replacements to the system that can occur as a result of natural disasters or unanticipated system failures.

The analysis presented in this report assumes the utility's reserve target is calculated by reserving 20% of operating & maintenance plus cash funded capital for the next fiscal year. This reserve target is dynamic and adjusts with total anticipated spending by the Utility in each year.

This level of reserves is consistent with 1) our industry experience for similar systems, 2) the findings of reserve studies conducted by the American Water Works Association, and 3) a healthy level of reserves for a municipal utility system per the evaluation criteria published by the municipal utility ratings agencies, such as Fitch and Standard & Poor's.

## 2.2.5 Capital Project Funding

One of the main drivers of a utility's financial plan is ensuring that sufficient funds are available for reinvestment in existing infrastructure and supporting new investment in the system. The RSA includes the CIP provided by City staff for FY 2025 through FY 2035. Beginning in FY 2027, the financial management plan assumes an annual cost inflation of 3.0% applied to each project to account for future inflation in the cost of construction. In addition, it has been projected that the City will be able to execute 100% of the CIP appropriations presented herein, consistent with past spending trends. Most of the projects identified will be paid through the operating fund, however from FY 2029 – FY 2031, approximately \$51.1M in projects will be financed through future bond proceeds, pending a successful referendum at that time.

## 2.3 RESULTS

Once the FAMS model was populated with the foundational data and assumptions as described in the proceeding narrative, a diagnostic run of the model was performed. In the diagnostic scenario, the financial results of the Utility are projected while holding rate revenues at current levels throughout the projection period. The results of this scenario are shown below in Figure 2-1. Without a rate revenue adjustment, the Utility is expected to drop below its policy minimum reserve target in FY 2026 and deplete cash reserves

entirely by FY 2027. This is not a sustainable scenario and would almost certainly impair the Utility's ability to maintain the current level of service provided to customers.

Figure 2-1: Annual End of Fiscal Year Reserves Diagnostic Scenario

In order to avoid the outcomes associated with the diagnostic scenario, a recommended plan of rate revenue adjustments was formulated that allows the Utility to meet its financial requirements, while minimizing the impact on customers. Table 2-1 displays the recommended annual rate revenue adjustments required for the utility to meet its minimum operating requirements for the next five years.

	FY 2026	FY 2027	FY 2028	FY 2029	FY 2030
Rate Increase Adoption Date	Oct 1, 2025	Oct 1, 2026	Oct 1, 2027	Oct 1, 2028	Oct 1, 2029
Water Rate Revenue Increase	12.0%	10.0%	3.0%	3.0%	3.0%

Figure 2-2 displays the projection of reserve balances with the application of the recommended rate revenue adjustments annually. The recommended plan will help ensure the Utility is financially sustainable over the next five fiscal years. Appendix A includes detailed schedules presenting all components of the financial management plan.

Figure 2-2: Annual Fiscal Year End Reserves Recommended Scenario

#### **National Water & Sewer Cost Trends**

The recommended annual rate revenue adjustments identified herein are within the range of rate increases for communities across the United States after the initial revenue realignment in FY 2026 and FY 2027. As demonstrated in Figure 2-3, the U.S. Consumer Price Index (CPI) Water & Sewerage Maintenance Series, which specifically measures the average national change in the cost of water and sewer service to households, has risen at an average annual rate of approximately 4.0% during the past ten years. The national level of water and sewer rates is reflective of Stantec's experience with utilities across the country that require similar levels of increases in rates to address aging infrastructure, declining demands, increasing regulatory requirements, and cost inflation.

Figure 2-3: US CPI & Water & Sewerage Maintenance Series

# 3. COST ALLOCATION

A cost-of-service analysis (COSA) was performed for the water utility system in order to identify the functional cost of providing service and to assign that cost proportional to each rate class based upon its unique contributions to or use of the system's functions. Many municipal service providers consider constructing rates or user fees that adhere to proportionality and cost of service principles an important objective. Because of the benefits of cost-based rates, this study seeks to enhance the defensibility and transparency of the City's cost of service allocations and develop fair and equitable charges for all customer or rate classifications.

The following steps occurred to perform the COSA analysis:

- Determine the rate revenue requirements for a specified annual period referred to as a test year. Rate revenue requirements are defined as the amount of money the City must recover from the rates charged to customers in order to meet the operating and capital expenditures anticipated for the test year. The revenue requirements are described earlier in more detail in the financial planning results section. For purposes of evaluating alternative rates and rate structures, FY 2026 has been agreed upon as a reasonable test year, inclusive of the 12% increase in rate revenue identified in section 2.
- Allocate the revenue requirements to functions and customer classes by following cost allocation guidelines from AWWA commonly referred to as base plus extra capacity. Revenue requirements are allocated to the functions of the water system as well as to specific system parameters based on how various uses impact the system. The cost of providing service is summarized at the end of this section.

## 3.1 ASSUMPTIONS

The test year rate revenue requirements used in the cost allocation were based on FY 2025 projected operating, capital, and debt service expenses from the revenue sufficiency analysis as that is the most recent year of line-item detail available. Operating expenses were allocated to various water functional components such as supply, treatment, transmission, distribution, meters, customer service, public fire protection, and admin.

A detailed list of the gross test year rate revenue requirements can be seen in Schedule 1 of Appendix B and are summarized in Table 3-1.

Revenue Requirements	FY 2025
Operations & Maintenance	\$22,825,153
Transfers	\$4,145,098
Debt Service	\$6,731,529
Cash Funded Capital	\$4,217,160
Gross Rate Revenue Requirement	\$37,918,940

#### Table 3-1: Gross Test Year Rate Revenue Requirements

#### **Offsetting Revenue**

The net rate revenue requirements are developed based on the total rate revenue required in FY 2026 after accounting for offsetting revenues, including the use of fund balance. As such, offsetting revenues were subtracted from the test year gross rate revenue requirement so that the resulting amount reflects the net rate requirements for FY 2026, including an increase in rate revenues of 12% over FY 2025 levels, as identified in section 2 of this report. Offsetting revenues include permit fees, water equity fees, and other miscellaneous revenues. Use of fund balance in FY 2026 is also considered as an offset to the revenue requirement because FY 2026 rates are not needed to generate this portion of costs based on the FY 2026 financial plan results. A detailed list of the test year net rate revenue requirements can be seen on Schedule 2 of Appendix B and are summarized in Table 3-2.

 Table 3-2: Calculation of FY 2026 Net Rate Revenue Requirement

Revenue Requirement	
Operations & Maintenance	\$22,825,153
Transfers	\$4,145,098
Debt Service	\$6,731,529
Cash Funded Capital	\$4,217,160
Offsetting Revenues	\$(3,842,606)
Net Rate Revenue Requirement	\$34,076,335

# 3.2 FUNCTIONALIZED SYSTEM COSTS

Within the water system, functionalized costs were allocated to customer classes as outlined in the AWWA M1 Manual. The following figure shows a general framework for how the water system was first broken down into broad functions (supply, treatment, transmission, distribution, customer, public fire protection) and then allocated to parameters (average day demand cost, max day demand cost, peak hour cost, or customer-related cost).

Figure 3-1: Water Cost Allocation Framework

Following the framework expressed in Figure 3-1 each line item in the operations and expense budget was reviewed with City staff and allocated to functions. Allocations were made directly, based on fixed assets, capital investment plans and several other metrics depending on which best represents the given expenditures relation to the overall water system. The results are summarized in Table 3-3 below, while appendix B provides detailed schedules for each expense.

Function	Amount
Source of Supply	\$4,520,049
Treatment Costs	\$6,391,273
Transmission Costs	\$3,907,810
Distribution Costs	\$11,567,009
Meters Costs	\$2,671,040
Customer Service Costs	\$1,030,600
Public Fire Protection Costs	\$635,768
Administration Costs	\$3,352,786
Net Revenue Requirement	\$34,076,335

Table 3-3: FY 2026 Net Revenue Requirement by Function

Upon the allocation of the water system's net revenue requirements to system functions as shown in Table 3-3, the next step was to allocate functions to parameters. Parameters in a base plus extra cost allocation framework refer to the particular type of demand that the water system's functions are delivering when demanded by customers. Demands can be hydraulic such as average day demand or max day demands, or billing questions reflected in the customer parameter, as well as others. To transform the functional net revenue requirement to a parameter basis, water production data is relied upon to delineate the system's peak demand characteristics into average, max hour and peak hour factors. Figure 3-2 displays a single year of water production data shown in millions of gallons daily and illuminates how demand evolves over

the course of a year. Specifically, the City's water infrastructure must meet higher seasonal demands in the summer months and lower demands in the winter months. This is a rather normal occurrence for a midwestern water utility, however it does represent a clear challenge for the utility, as peak demands in the summer can exceed 170% of winter demands on a peak hour basis. The utility must invest in a system to meet these demands 24/7 when and where they occur on the system. As such the system has been configured and invested in a manner to be able to provide year-round service, inclusive of periods of high demands. However, that invested capacity comes at a cost and this component of the cost-of-service study will define the specific revenue required annually to meet different demands.

In determining the max day and peak hour factors, Stantec received four historical years of hourly water production data from the City. Broadly, the years are consistent with each other in terms of the production demands that the City's system meets. However, annual variation in use does exist and it would be unadvisable to use just one year of data that could be biased by a drought for example. As such Stantec averaged the last 4 years' worth of data to create representative average day, max day and peak hour factors. The results are show in Table 3-4 and demonstrate that on a max day basis water demands, and peak hour demands are 1.5 and 1.8 times the average respectively.

Year	Average Day	Max Month	Max Day	Peak Hour
2021	14.08	18.51	21.13	25.49
2022	14.36	17.82	22.29	25.11
2023	13.52	16.92	20.09	24.93
2024	13.39	15.88	19.66	22.58
Average (MDG)	13.84	17.28	20.79	24.53
Max Day Factors	67%		33%	
Peak Hour Factors	56%		29%	15%

#### Table 3-4: System Units of Service in MGD

With the established max day and peak hour factors calculated in Table 3-4 based on system demand characteristics, Table 3-5 displays how the factors were applied to the different functions based on detailed conversations with City staff regarding the water system's physical infrastructure and how demands are currently served. For example, the City's wells are connected directly to the treatment plant and as such the City has sized the number and capacity of wells to meet not only average day demands but also max day demands. Distribution on the other hand includes a peak hour allocation reflecting the annual cost of elevated storage, system redundancies/reliability, and hydraulic design of the distribution system to maintain pressure during peak hour use in addition to average and max day demands. Each function was evaluated in this manner and Table 3-5 displays the allocation factor and resulting total allocation to parameter. The resulting cost by parameter will be used in the rate design section to create rates that align in terms of revenue generation needs of the system in total but also show a strong nexus to cost-causation, based on how customers use the City's water service.

Function	FY 2026 Revenue Requirement	Base Capacity	Extra Capacity (Max Day)	Extra Capacity (Peak Hour)	Customers	Public Fire Protection	Meters
Source of Supply	\$4.5M	67%	33%				
Treatment	\$6.4M	67%	33%				
Transmission	\$3.9M	67%	33%				
Distribution	\$11.6M	56%	29%	15%			
Meters	\$2.7M						100%
Customer	\$1.0M				100%		
Service							
Fire Protection	\$0.6M					100%	
Administration	\$3.4M	53%	27%	6%	3%	2%	9%
Total	\$34.1M	\$18.2M	\$9.1	\$1.9M	\$1.1M	\$0.7M	\$3.0M

#### **Table 3-5: Water System Functions to System Parameters**

# 4. RATE DESIGN

Stantec calculated rates based on the recommended rate revenue adjustment for FY 2026 described in section 2 (12% adjustment over FY 25), the cost allocation described in section 3, and FY 2024 customer billing data. The rate design calculates rates for each of the City's customer classes, which includes inside city and outside city customers. Rates include a fixed charge scaled by meter size and a volumetric or variable rate charged per unit of billed volume in terms of hundred cubic feet or CCF. This section also includes bill impacts for typical customers and a comparison to other local utilities.

Tables 4-1, 4-2, and 4-3 display the current water rates that are in place in FY 2025. They are split between fixed charges which are billed regardless of use based on meter size and volumetric charges which vary by use and season. The City applies these rates across all customers within the City with the exception of irrigation customers who get charged at the tier 3 rate during the summer and tier 1 rate during the winter.

Meter Size	Inside City	Outside City	Fire Flow Charge	Total Inside City
5/8"	\$12.48	\$16.60	\$1.59	\$14.07
3/4"	\$12.48	\$16.60	\$1.59	\$14.07
1"	\$20.15	\$26.80	\$1.69	\$21.84
1.5"	\$40.52	\$53.89	\$2.44	\$42.96
2"	\$61.41	\$81.68	\$2.63	\$64.04
3"	\$189.99	\$252.69	\$6.31	\$196.30
4"	\$398.45	\$529.94	\$9.75	\$408.20
6"	\$850.20	\$1,130.77	\$19.51	\$869.71

Table 4-1: FY 2025 Fixed Charges

#### Table 4-2: FY 2025 Winter Volumetric Rates Winter

October through May					
Tier Inside City Per CCF Outside City per C					
All Use	\$3.22	\$4.283			

#### Table 4-3: FY 2025 Summer Volumetric Rates

June through September						
Tier	Inside City Per CCF	Outside City per CCF				
Tier 1 0%-70% of Winter Average Consumption	\$3.22	\$4.283				
Tier 2 71%-170% of Winter Average Consumption	\$4.44	\$5.905				
Tier 3 > 170% of Winter Average Consumption	\$6.89	\$9.164				

# 4.1 RATE DESIGN OBJECTIVES

The following subsections of the report detail the recommendations related to changes within the City's water rates. In developing the recommendations Stantec weighs several competing objectives to arrive at the set of modifications that seeks to best serve the community. The following objectives and more were considered in the development of rates:

- Simplicity
- Revenue needs of the utility
- Adherence to cost of service findings
- Cost causation nexus

# 4.2 FIXED CHARGE

As it relates to determining monthly fixed charges for the water utility, common industry practice differentiates such charges based on meter size and scales the cost proportional to the service being rendered. Specifically, it is recommended that the City recovers customer, meter, public fire protection and a portion of average day costs which reflects readiness to serve in the monthly fixed charges. These specific revenue requirements lend themselves to fixed cost recovery in that they don't vary with use. Table 4-4 displays the current meter counts by meter size and applicable scaling factors for customer, capacity, and meter costs. Customer costs do not vary by meter size thus have been scaled equal per bill issued. Capacity scaling is based on the meter size and specifically, the differential between max flow rates in gallons per minute between a 5/8" and other, larger meter sizes. Meter cost scaling is based on the current cost the city incurs for replacing a 5/8' meter vs larger sizes.

	•			
Meter Size	Meter Count	Customer Bill Scaling	Capacity Scaling	Meter Cost Scaling
5/8"	48,622	1.0	1.0	1.0
3/4"	227	1.0	1.0	1.0
1"	1,978	1.0	2.5	1.2
1.5"	484	1.0	5.0	2.0
2"	458	1.0	8.0	9.1
3"	58	1.0	17.5	11.4
4"	26	1.0	37.5	12.8
6"	11	1.0	67.5	20.4
8"	0	1.0	80.0	30.7

The scaling factors included in Table 4-4 are shown aligned with distinct system costs from the cost allocation completed in section 3 in Table 4-5 and divided by the City's total applicable units to create a unit cost which will be used to construct updated charges shown in Table 4-6. The total annual units in Table 4-5 were generated by applying the scaling factors to the system's current meter counts by size and

annualizing. Capacity cost net revenue requirements reflect 30% of average day cost and all public fire protection cost identified in section 3's cost of service analysis. Recovering a portion of average day cost is common for water utilities and is normally referred to as readiness-to-serve. This reflects the water utility's state of readiness in operating a system that stands ready to meet customer demands where and when they occur on the system year-round 24/7. Another key component of fixed charges is the amount of overall revenue that is recovered from these charges which provide the utility with a degree of revenue stability. The utility currently recovers 29% of total revenue though fixed charges. The calculated fees based on the detailed cost assignment included herein (customer, meter, public fire protection and a portion of average day cost) will generate 30% of revenue through fixed costs essentially maintaining current fixed cost recovery levels, which are in alignment with industry standards.

Table 4-5: Unit Cost Calcula	tion
------------------------------	------

Meter Size	Customer	Capacity	Meter Cost
Net Revenue Requirement	\$1,143,067	\$6,157,933	\$2,962,524
Number of Bills Annually	622,385		
Equivalent Meter Capacity Units		751,429	
Equivalent Meter Cost Units			690,880
Unit Cost	\$1.84	\$8.19	\$4.29

Based on the identified cost to be recovered in the fixed monthly charges in Table 4-5, scaling factors in Table 4-4, FY 2024 units of service in Table 4-4 and unit cost in Table 4-5, Table 4-6 displays the calculated fixed monthly cost by meter size based on the summation of each cost component.

Meter Size	Customer Cost per Bill	Capacity Scaling	Meter Cost	Total Inside City	Total Outside City
5/8"	\$1.84	\$8.19	\$4.29	\$14.32	\$17.90
3/4"	\$1.84	\$8.19	\$4.29	\$14.32	\$17.90
1"	\$1.84	\$20.48	\$5.14	\$27.46	\$34.33
1.5"	\$1.84	\$40.95	\$8.60	\$51.39	\$64.24
2"	\$1.84	\$65.52	\$38.91	\$106.27	\$132.84
3"	\$1.84	\$143.33	\$49.00	\$194.17	\$242.71
4"	\$1.84	\$307.13	\$54.82	\$363.79	\$454.74
6"	\$1.84	\$552.83	\$87.38	\$642.05	\$802.56
8"	\$1.84	\$655.20	\$131.69	\$788.73	\$985.91

Table 4-6: Calculated Fixed Charges

Table 4-7 displays the calculated fixed cost compared to the current fees (including the fire charges). Meters with sizes in the 1" to 2" range display the largest variance to the current cost to serve. It is Stantec's recommendation that cost based fixed charges be implemented. Also, full bill impacts will be shown later in this section, which include the volume component for full understanding of how a customer's bill will change.

Meter Size	Current	Calculated	Change \$	Change %
5/8"	\$14.07	\$14.32	\$0.25	1.8%
3/4"	\$14.07	\$14.32	\$0.25	1.8%
1"	\$21.84	\$27.46	\$5.62	25.7%
1.5"	\$42.96	\$51.39	\$8.43	19.6%
2"	\$64.04	\$106.27	\$42.23	65.9%
3"	\$196.30	\$194.17	\$(2.13)	-1.1%
4"	\$408.20	\$363.79	\$(44.41)	-10.9%
6"	\$869.71	\$642.05	\$(227.66)	-26.2%
8"		\$788.73	N/A	N/A

Table 4-7: Calculated Inside City Fixed Charges Compared to Current

## 4.3 VOLUMETRIC RATE

Volumetric or variable rates recover the remaining portion of revenue requirements not recovered by the monthly fixed charges, in order to ensure the full net rate revenue requirements are met. The City currently has volumetric rates that are individualized to each customer based on each customer's winter average use in the sizing of each tier that applies to a given customer's volume. Additionally tiers only apply during the summer months of June through October. In order to arrive at the recommended modification to volumetric tiers, Stantec followed a data driven analysis of usage and gave careful consideration of the cost-of-service results, which clearly identifies the cost associated with average day, max day and peak hour use. Figure 4-1 displays the system wide volume as billed in FY 2024 by tier, which served as the starting point for the analysis.

Key observations and recommendations on the current volumetric rate structure:

The current first tier is rather restrictive at 70% of winter average consumption. In practice this
means that a consistent user who uses the same amount of water each month is effectively
punished in the summer months when 30% of their usage now falls into tier 2.

**Key Recommendation:** Reset the tier 1 maximum volume to be 100% of winter average consumption by user. This change will allow a customer with steady use to remain in tier 1 year-round and not unduly punish consistent volumetric users.

2) Figure 4-1 displays the monthly billed volume for the City water utility. Notably the current seasonal tiered structure is unable to bill shoulder month use. Specificity in May and November usage tends to be above the average of December through April, indicating that some users are still ramping up or down seasonal peak demands.

**Key Recommendation:** Apply volumetric tiers year-round in order to detect and bill customer peak use correctly when that use occurs, even outside of the currently defined seasonal window.

3) One objective of this rate study is to ensure a strong link between a customer's use and the proportion of system cost they bare. The current tiers are not priced according to the cost of providing service, specifically meeting peak demands.

**Key Recommendation:** Use the findings from the cost of service performed in section 3 to price volumetric tiers based on the actual cost to serve. This will create a strong cost causation nexus between use and cost, providing the correct pricing signal to customers about the utility's cost structure.

It is recommended that tier 1 be resized to encompass 100% of winter average consumption in order to avoid punishing a consistent user, which currently has 30% of their volume billed at the tier 2 rate in the summer months. Tier 2 is then recommended to span from 100% to 200% of winter average consumption. This amount is consistent with the water utility overall demand change from the winter average volume to the systems max day. All additional volume would be captured in tier 3 which includes all use above 200% of winter average consumption for a customer. Figure 4-2 provides a side-by-side comparison of the current tier spans and the recommended tier spans.

Figure 4-2: Current Tiers vs Calculated Tiers<sup>2</sup>

In addition to updating the volumetric consumption tier widths, it is recommended that the tiers apply yearround in order to ensure that the rate structure has the sensitivity to identify peeking demands when they happen on the system and price them accordingly. Figure 4-3 displays FY 2024 volumetric demands with the recommended tier widths applied year-round. Peak demands are now identified outside of the summer months as shown in blue and purple which denote tier two and tier three billable volume. Additionally tier one volume now shows much more stability throughout the year as the current 70% of winter average consumption no longer forces volume into higher tiers in the summer.

<sup>&</sup>lt;sup>2</sup> Tier 3 includes all use above 170% of winter average use currently and all use above 200% in the calculated Tiers.

Figure 4-3: FY 2024 Monthly Volume by Tier Applied Year-Round

In order to provide cost of service-based pricing for the recommended three tier volumetric rates, this analysis first relied upon the cost-of-service findings which established the cost associated with the utility's providing different types of service, characterized by average, max day, and peak hour. Table 4-8 displays the net revenue requirements associated with the volumetric parameters as identified in section 3. Average day net revenue requirements are shown at 70% in order to account for the 30% that is recommended to be recovered in monthly fixed charges as the readiness-to-service component, all other parameters are displayed at 100%.

Table 4-8:	Cost of	Service	Volumetric	Parameters
------------	---------	---------	------------	------------

	Average Day (70%)	Max Day	Peak Hour
Net Revenue Requirement	\$12,723,165	\$9,135,754	\$1,953,892

In order to distribute the net revenue requirements by volumetric parameter to each of the three tiers, two units of measurement were considered. The first is the distribution of billed volume by tier as shown in Table 4-9. Secondly, a measurement was made of the total number of annual CCF from the tier minimum billed month to the maximum billed month to create a measurement of max use.

Tier	Billed Units CCF	Max to Min	Billed Units %	Max to Min %
Tier 1	3,750,012		67.8%	
Tier 2	778,674	513,520	14.1%	34.4%
Tier 3	1,005,698	979,302	18.1%	65.6%

Table 4-9: Units of Service

Table 4-10 provides the calculation of volumetric tiers by combining the cost of service for average day, max day and peak hour, proportionate to the cost requirements to each tier and then dividing by the billable units by tier. Average day costs were proportioned based on the distribution of billable volume between tiers. Max day costs were distributed into tier 2 & 3 based upon the total change in billable CCF for each tier from the min month to the max month. This allocation factor provides a basis for determining the relative max day contribution of tier 2 vs tier 3 and distributing the max day cost. All peak hour costs have been

included in tier 3, which reflects customer usage over 200% of winter average consumption which aligns with the system average to max day factor.

	Net Revenue Requirement	Tier 1	Tier 2	Tier 3
Average Day Allocation %		67.8%	14.1%	18.1%
Max Day Allocation %			34.4%	65.6%
Peak Hour Allocation %				100%
Average Day Allocation \$	\$12,723,165	\$8,617,895	\$1,789,470	\$2,311,192
Max Day Allocation \$	\$9,135,754		\$3,141,497	\$5,990,949
Peak Hour Allocation \$	\$1,953,892			\$1,953,184
Billable Units		3,750,012	778,674	1,005,698
Average Day Unit Cost		\$2.30	\$2.30	\$2.30
Max Day Unit Cost			\$4.03	\$5.96
Peak Hour Unit Cost				\$1.94
Total Cost Per Unit (CCF)		\$2.30	\$6.33	\$10.20

**Table 4-10: Volumetric Tier Price Calculator** 

# 4.4 FILL RATE

In addition to the standard base and volumetric water rates described previously, the City requested that Stantec develop a proposed rate for the filling of portable tanks by vehicles or equipment. The City does not currently offer or charge for this service. To calculate a rate, Stantec relied on the cost-of-service findings outlined in Section 3.

Portable tank users by definition are transitory and utilize only the volumetric component of the water system without placing demands on customer service, fixed meters or public fire protection functions. The proposed rate reflects only the costs associated with water delivery. Specifically, the rate presented in Table 4-11 is based on the average cost per CCF of water service, accounting for costs incurred during average day, maximum day, and peak hour demand conditions. This approach ensures that the proposed charge is aligned with the actual cost of providing water to these short-duration users and recognizes that they do not pay base charges like a normal customer.

Cost Type	Amount
Average Day	\$18,175,950
Max Day	\$9,135,754
Peak Hour	\$1,953,892
Billable Units (CCFs)	5,534,384
Unit Rate per CCF	\$5.29

Table	4-11:	Fill	Rate	Calculation
Iable			Itate	Valculation

# 4.5 BILL IMPACTS

The City's current rate structure applies uniquely to each customer based on the measured winter average consumption, seasonal application of the tiered structure and the customer's peak usage characteristics.

In order to compare current customer annual bills to the annual bills under the recommended changes, the following figures (4-4,4-5,4-6,4-7,4-8) provide a representative distribution by customer class. Green bars indicate the percentage of bills that are expected to decrease at each given dollar change level whereas blue bars are increases in bills. The main determinate of whether a customer's bill goes up or down under recommended changes is connected to the peaking behavior the customer exhibits. Customers with steady usage as compared to their winter average consumption are expected to have minimal impacts to their bills, and many will benefit from the calculated rates.

\$ Bill Change

Figure 4-5: Large Commercial Bill Change Distribution

Annual Bill \$ Change

Figure 4-7: Residential Irrigation Bill Change Distribution

Annual Bill \$ Change

Annual Bill \$ Change

## 4.6 CUSTOMER BILL COMPARISON

As part of the Study, Stantec prepared a FY 2025 residential rate survey that compares the current and calculated monthly bill for the City's typical single family residential user to that of neighboring communities. Figure 4-9 presents a comparison of the monthly water charges of local communities for a single-family residential customer with a 5/8" meter based on 5 CCF of monthly billed water volume. As can be seen, the

City is currently average among the providers in the area for a typical residential user and the recommended changes will lessen the monthly bill for steady residential user.

Figure 4-9: Water Monthly Single-Family Residential Bill Comparison (5 CCF)

## 4.7 AFFORDABLITY

During the course of the rate study Stantec was asked to calculate two affordability metrics in order to assess the current burden of water bills on economically disadvantaged populations in the service area. The hours worked at minimum wage and AR20 (affordability ratio) at the 20<sup>th</sup> percentile of household income) were used in the study. Figure 4-10 displays the resulting calculations before and after the calculated rate modifications presented herein. With regards to the hours worked at minimum wage a water bill is considered moderately burdened at 8 hours and heavily burdened at 12 hours or more. With regards to the AR20 2% is key threshold above which a customer is considered burdened. Currently Columbia's water bills at the 5 CCF level are considered affordable by these metrics and the calculated rates will improve affordability. It should be noted that a key determinate of a customer's bills currently and under the calculated rates is the volume of seasonal demands. Keeping usage as consistent as possible will allow customers to attain the most affordable bills at a given usage level.

## Figure 4-10: Affordability Metrics at 5 CCF of Monthly Use

## 4.8 MASTER METER POLICY

The City has requested that Stantec review and provide feedback on its current policy regarding the use of master meters in the water utility system. Master metering is a configuration in which a single, centralized water meter measures the total water consumption for an entire property, such as a multi-unit residential or commercial development. This differs from standard metering practices where each dwelling unit or customer has an individual meter and account.

The City currently has existing customers with master meters and permits new multi-unit developments to utilize this configuration. Across the U.S., water utilities take varied approaches to master metering, some prohibit it entirely for new construction, while others allow it. As the City considers whether to maintain, revise, or restrict the use of master meters, it is important to weigh the associated tradeoffs.

Table 4-12 includes a summary of the key advantages and disadvantages of master metering:

Pros	Cons
Lower infrastructure and maintenance costs since	Weaker conservation incentives because
only one meter is needed.	individual residents aren't directly billed.
Simplifies utility administration with fewer customer	Raises equity concerns when low-usage
accounts to manage.	residents subsidize those who use more.
Allows property owners to manage water use	Can lead to billing disputes if tenants question
internally through submetering or allocation.	how water costs are divided.
More practical for older buildings or tight spaces	Limits the utility's ability to monitor usage
where individual metering is difficult.	patterns or detect leaks at the unit level.
Makes meter reading easier with just one meter per	Makes it harder for the utility to shut off service
property.	for individual non-paying units.

### Table 4-12: Master Metering Pros and Cons

Given these factors, Stantec recommends that the City continue to allow master metering in recognition of its operational simplicity and lower infrastructure costs. While there are tradeoffs, this approach remains appropriate for many multi-unit developments and is consistent with common utility practices across the country, including the Midwest. Maintaining this policy provides flexibility for property owners and supports efficient service delivery without requiring additional administrative or capital burdens.

## 4.9 WATER EFFICENCY PROGRAMS

Columbia's water conservation programs reflect a thoughtful and well-rounded approach to reducing both indoor and outdoor water usage. The City offers a range of rebates and educational resources that help residents and businesses take measurable steps toward greater efficiency. These programs promote water savings through practical upgrades like WaterSense-certified toilet replacements, smart irrigation system retrofits, and better landscaping practices. Columbia also supports public education around leak detection, efficient appliance use, and lawn irrigation strategies, all tailored to local consumption patterns. Together, these efforts help the City reduce peak demand, delay capital costs, and promote long-term sustainability.

Program	Description	Rebate		
Toilet Replacement	Replace existing toilets with WaterSense-	Up to \$75 per toilet (max 2 per		
(Residential)	certified models	address)		
(itesideritial)		autiess)		
Toilet Replacement	Replace older fixtures in commercial	Up to \$100 per toilet (up to 4, with

Juda an Atatawa	last data ting bink afficience for			
Indoor Water	Leak detection, high-efficiency fixtures,	N/A		
Conservation Tips	and behavior-based guidance			

Table 4-12: Summary of Columbia Water Conservation Programs

These programs are well-structured, financially accessible, and rooted in established conservation practices. To build on this strong foundation, the City might consider small enhancements such as expanding the cap on qualifying fixture rebates or publishing annual program results to showcase aggregate water savings. These steps would reinforce the City's leadership in water stewardship while increasing visibility and participation across the community.

# 5. WATER SYSTEM EQUITY CHARGE

Stantec updated the City's water system equity charge (connection fee) based on the cost of the historical investments made to provide the current infrastructure and water system capacity. This section of the report presents the results of the update, including background information, an explanation of the calculation methodology employed, results of the analysis, and a comparative connection fee survey for local communities.

# 5.1 BACKGROUND

The City currently assesses water system equity charges that are designed to recover the cost of capacity from new connections to the Utility. Water system equity charges are assessed against new development to cover the cost of providing capital infrastructure needed to serve new developments. Such charges are the mechanism by which new growth can "pay its own way" and minimize the extent to which existing customers of the Utility must bear the cost of new or expanded facilities that are necessitated by new connections. The City assesses water system equity charges as described herein based on the most current local data available.

# 5.2 METHODOLOGY

There are three primary approaches to the calculation of water system equity charges. The buy-in approach determines the replacement cost of major functional components as the cost basis for the water system equity charge calculation. This approach is most appropriate for a system with considerable excess capacity such that most new connections to the system will be served by that existing excess capacity.

The incremental approach uses the portion of the multi-year CIP associated with the provision of additional system capacity by functional system component as the cost basis for the water system equity charge calculation. This approach is most appropriate where the existing system has virtually no excess capacity to accommodate growth and the CIP has a significant number of projects that provide additional system capacity for each functional system component to be representative of the cost of capacity for an entire system.

The third approach is to use a combination of the two approaches described above. The combined approach is most appropriate when there is excess capacity in the current system that will accommodate some growth and the CIP includes some projects that will provide additional system capacity but does not necessarily have a sufficient number of projects in each functional area to be reflective of a total system. Using the combined approach effectively provides water system equity charges that reflect a weighting of the cost of current excess capacity and the cost of future capacity to be provided in the CIP, both of which will be required to accommodate new connections to the system.

For calculating the City's water system equity charge, the buy-in approach was used as there is currently capacity to serve new connections and there are no significant expansion-related capital projects in the near-term CIP.

# 5.3 CALCULATION

#### **Cost Basis**

The first step in calculating the water system equity charge was to determine the capacity cost for each major system function: supply/treatment and transmission/distribution. The cost basis for this analysis includes the replacement cost new less depreciation (RCNLD) of the City's existing assets, including any major work in progress not already reflected in the City's fixed asset registry.

The RCNLD value for each of the City's existing major water components was based upon the City's fixed assets in service as of December 31, 2024, escalated to FY 2025 replacement cost, based upon the change in the Engineering News-Record Construction Cost Index (ENR-CCI) from acquisition date, less any excluded assets<sup>3</sup>. Schedule 1 of Appendix C presents the calculated FY 2025 RCNLD for each of the City's existing assets, or portion thereof, determined as eligible for inclusion in the cost basis of the fees. Fixed assets were allocated by functional component based upon asset description as well as input from City staff.

Once eligible costs were identified for each functional component, an adjustment was made to deduct the outstanding principal associated with the portion of eligible costs that have been and will be funded with debt. This adjustment is applied as a credit to the cost basis of the plant in service value. Upon connecting to the water system, new connections will begin to use water services and will pay the rates associated with those services. The rates for those services recover the principal and interest payments (debt service) associated with the debt incurred to fund the capital costs of the water system. Therefore, because debt service is recovered in rates and in order to avoid a double recovery of those capital costs in both water system equity charges and rates, a credit was calculated based upon the remaining principal portion of outstanding debt service as of December 31, 2024.

In addition, the cost basis includes construction work in progress for a water treatment plant expansion of approximately \$36.9M, per conversations with City staff. Construction work in progress represents costs of assets not yet reflected in the asset listing used for the analysis.

<sup>&</sup>lt;sup>3</sup> Excluded assets are assets that are repair or replacement in nature, assets that were contributed by developers, or minor equipment.

#### **System Capacities**

The capacities in millions of gallons per day (MGD) provided by functional components were identified and discussed with City staff. However, for the purpose of this analysis the system's limiting capacity was utilized which reflects the water plant's maximum capacity of 32 MGD.

#### Capacity per Equivalent Residential Unit (ERU)

The capacity costs for each functional component were then divided by the level of service capacity identified for each functional component, reflected in terms of ERUs, to determine the capacity cost per ERU by functional component. The level of service for a water ERU was determined based on total monthly usage per ERU and peak day demand factors, which reflect the typical FY 2024 average monthly flow. Water capacity per ERU is shown in Schedule 2 of Appendix C and in Table 5-1 at 227 gallons per day of flow.

# 5.4 RESULTS

The resulting water connection fee calculation is shown in the following Table 5-1.

		-	
	Supply / Treatment	Transmission / Distribution	Total
Gross Plant in Service Value	\$31,419,762	\$185,207,649	\$216,627,410
Construction Work in Progress	\$36,875,958	-	\$36,875,958
Gross System Value	\$68,295,720	\$185,207,649	\$253,503,368
Less: Principal Credit	(\$19,940,428)	(\$54,075,422)	(\$74,015,850)
Less: Asset Contributions/Exclusions	(\$22,003)	(\$14,386,553)	(\$14,408,556)
Net System Value	\$48,333,289	\$116,745,674	\$165,078,963
Capacity (MGD)	32.00	32.00	
Level of Service (gpd)	227	227	
ERUs	141,176	141,176	
Initial Capacity Cost per ERU	\$342	\$827	\$1,169
Escalation Factor to Effective Year			0.00%
Calculated Fee per ERU			\$1,169
Current Fee per ERU			\$576
Difference			\$593

### Table 5-1: Calculation of Water Connection Fee per ERU

The current FY 2024 and calculated water connection fees for all meter sizes are shown in Table 5-2. The calculated fees are shown scaled by the max meter flow ratios that we previous utilized in the construction of base charges in section 4 of this report and specifically shown in table 4-4.

Meter Size	Current Fee	Calculated Fee	Difference
5/8"	\$576	\$1,169	\$593
3/4"	\$576	\$1,169	\$593
1"	\$576	\$2,923	\$2,347
1.5"	\$1,296	\$5,845	\$4,549
2"	\$2,303	\$9,352	\$7,049
3"	\$5,182	\$20,458	\$15,276
4"	\$9,213	\$43,838	\$34,625
6"	\$20,729	\$78,908	\$58,179

Table 5-2: Curre	ent and Calculated	<b>Connection Fees</b>
------------------	--------------------	------------------------

# 5.5 CONNECTION FEE COMPARISON

As part of the Study, Stantec prepared a FY 2025 connection fee survey that compares the current and calculated connection fees for a 5/8" connection to that of neighboring communities, shown in Figure 5-1. As can be seen, the City is currently at the low end of the utilities surveyed and will be in the average range with the calculated fee, although significant differences between utilities do exist.

## Figure 5-1: Water Connection Fee Comparison (5/8" Meter)

It is important to note that connection fee calculations may vary significantly across utilities and no in depth analysis has been performed to identify the methods used in the development of the water connection fees imposed by the other public utilities in the survey, nor has any analysis been performed to determine whether 100% of the cost of new facilities is recovered from such fees (or if some percentage of the costs

are recovered through user fees). Additionally, no analysis was conducted as to the types of capital facilities currently in service or planned for the utilities surveyed. Some reasons why impact fees differ among utilities include the following:

- Type and complexity of treatment
- Source of Supply
- Density of service area
- Availability of grant funding to finance CIP
- Age of system
- Utility life cycle (e.g., growth-oriented vs. mature)
- Level of service standards
- Administrative policies

# 6. MISCELLANEOUS FEES

The City currently applies miscellaneous service charges for the provision of specific services to individual customers. Service installation fees, meter installation, and reconnect fees are examples of the types of services for which the City has various miscellaneous service charges. The primary intent of miscellaneous service charges is to ensure the recipient of the benefit of a specific service bears the cost associated with providing that service. Stantec created a cost-of-service template to be used for updating each existing miscellaneous service charge that City staff is proposing. The miscellaneous service charge developer was provided to staff as part of the study. Table 6-1 display the results of the analysis in terms of the current fees, cost of service and proposed fees.

Fee/Charge Title	Current Charge	Full Cost Recovery Charge	Current Cost Recovery (%)	Proposed Charge	Change (\$)	Proposed Cost Recovery
Service Initiation Fee	\$6.00	\$15.59	38.49%	\$15.00	\$9.00	96.22%
Disconnect/Reconnect Fee (Residential)	\$30.00	\$373.59	8.03%	\$30.00	\$0.0	8.03%
Disconnect/Reconnect Fee (All Other Customers)	\$100.00	\$373.59	26.77%	\$100.00	\$0.0	26.77%
Reconnect Fee - Same Day, Weekend, Holiday, After- Hours (Residential)	\$90.00	\$373.59	24.09%	\$90.00	\$0.0	24.09%
Reconnect Fee - Same Day, Weekend, Holiday, After- Hours (All Other Customers)	\$200.00	\$373.59	53.53%	\$200.00	\$0.0	53.53%

### Disclaimer

This document was produced by Stantec Consulting Services Inc. ("Stantec") for the City of Columbia and is based on a specific scope agreed upon by both parties. Stantec's scope of work and services do not include serving as a "municipal advisor" for purposes of the registration requirements of the Dodd-Frank Wall Street Reform and Consumer Protection Act (2010) or the municipal advisor registration rules issued by the Securities and Exchange Commission. Stantec is not advising the City of Columbia or any municipal entity or other person or entity, regarding municipal financial products or the issuance of municipal securities, including advice with respect to the structure, terms, or other similar matters concerning such products or issuances.

In preparing this report, Stantec utilized information and data obtained from the City of Columbia or public and/or industry sources. Stantec has relied on the information and data without independent verification, except only to the extent such verification is expressly described in this document. Any projections of future conditions presented in the document are not intended as predictions, as there may be differences between forecasted and actual results, and those differences may be material.

Additionally, the purpose of this document is to summarize Stantec's analysis and findings related to this project, and it is not intended to address all aspects that may surround the subject area. Therefore, this document may have limitations, assumptions, or reliance on data that are not readily apparent on the face of it. Moreover, the reader should understand that Stantec was called on to provide judgments on a variety of critical factors which are incapable of precise measurement. As such, the use of this document and its findings by the City of Columbia should only occur after consultation with Stantec, and any use of this document and findings by any other person is done so entirely at their own risk.
