

CMWL 100% RENEWABLE STUDY

PROJECT PURPOSE AND SCOPE

Project Purpose: 20-year study (2024-2043) to determine impact of achieving 100% renewable energy and capacity by 2030.

Project Scope:

- **Base Case**
- **Scenarios**
 - **Alternate case 1** – 100% renewable energy to serve CMWL load by 2030. Renewable energy credits (RECs) cannot be used to meet this requirement.
 - **Alternate case 2** – Same as alternate case 1, but RECs are used to meet the requirement.
 - **Alternate case 3** – Same as alternate case 1, but all coal resources are divested as soon as possible.
 - **Alternate case 4** – Same as alternate case 1, but all thermal resources are divested/retired as soon as possible.
 - **Alternate case 5** – Same as alternate case 1, with Sikeston retires early.

SCENARIO OVERVIEW

| Scenarios | 100% Renewable Requirement by 2030 | Use of RECs? | Divest Coal Resources | Retire Natural Gas Resources | Retire Sikeston |
|------------|------------------------------------|--------------|-----------------------|------------------------------|-----------------|
| Base Case | No | No | No | No | No |
| Alt Case 1 | Yes | No | No | No | No |
| Alt Case 2 | Yes | Yes | No | No | No |
| Alt Case 3 | Yes | No | Yes | No | Yes |
| Alt Case 4 | Yes | No | Yes | Yes | Yes |
| Alt Case 5 | Yes | No | No | No | Yes |

- Renewable energy credit (REC) – A tradable commodity representing 1 MWh of electricity generated from renewable sources.

MODEL ASSUMPTIONS

CAPACITY DEFINITIONS REVIEW

- **Nameplate capacity** – The maximum rated output of a generator.
 - Units are MW.
- **Firm capacity** – A measure of a generators ability to provide power to the grid when needed.
 - Calculated by MISO for planning requirements.
 - Columbia’s total firm capacity must be at or above forecasted peak load plus a reserve margin (7.4% during the summer season).
 - Units are MW.
- **Bilateral capacity** – Firm capacity that is purchased directly from another utility/resource owner.
 - Purchased when additional firm capacity is needed to meet planning requirements.
 - This purchase can be long-term (10+ years) or short-term (one year/one season).
 - Units are MW.

FIRM CAPACITY FOR RENEWABLES

- Renewable resources are assumed to receive firm capacity based on performance during high-risk periods.
- Known as Effective Load Carrying Capacity.
- Based on MISO's 2022 Regional Resource Assessment.
- Change over time is due to changes in generation mix on MISO's system.
- Thermal resource firm capacity is assumed to remain flat throughout the study.

RESOURCE OPTIONS

| Resource Option | Fuel Type | Variable O&M (\$/MWh) | Fixed O&M (\$/kW-yr) | Nameplate Capacity (MW) | Contract Length (years) | Lead Time (years) |
|------------------------------|-------------|-----------------------|----------------------|-------------------------|-------------------------|-------------------|
| Solar PPA | Solar | 57.50 | 0 | 50 | 15 | 3 |
| Wind PPA | Wind | 45.00 | 0 | 50 | 15 | 3 |
| Battery Storage PPA (4-Hour) | Lithium-Ion | 0 | 138 | 25 | 15 | 3 |
| Bilateral Capacity PPA | N/A | 0 | 90 | 5 | 1 | 0 |
| Renewable Energy Credit | N/A | 3.50 | 0 | N/A | 1 | 0 |

Figures are initial 2023 values; PPA rate and capacity prices change through the duration of the study

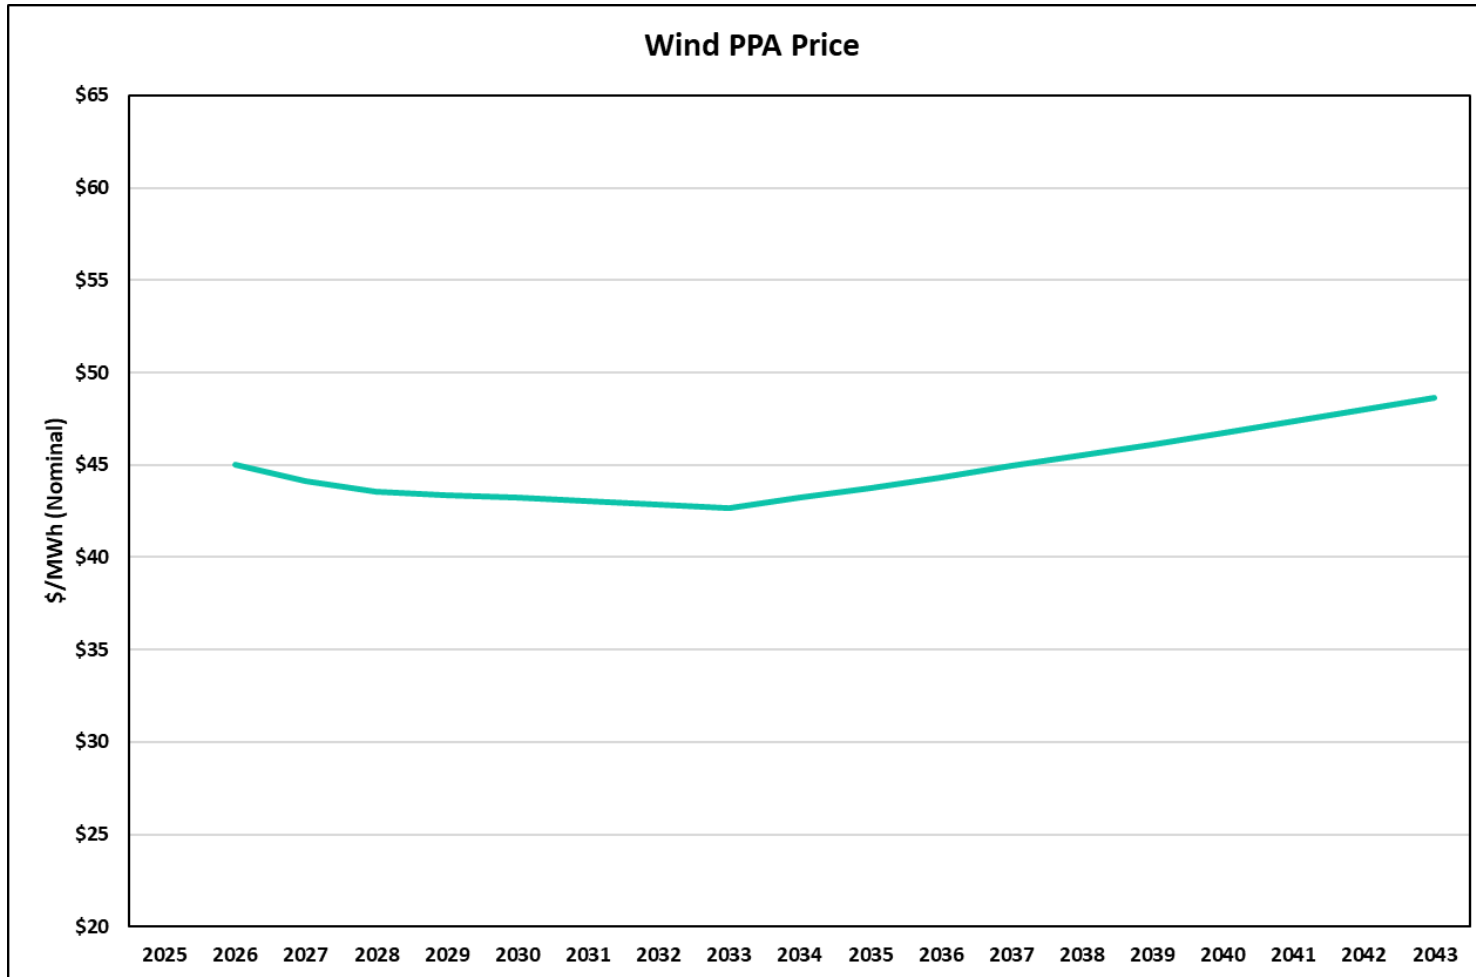

- Purchase power agreement (PPA) – An agreement to purchase power from a generation owner.

SOLAR PPA PRICE

- Prices reflect year project begins operation (3-year lag from when PPA is signed)
- Price forecasts derived using:
 - LevelTen Energy data
 - Capital cost projections from NREL and S&P Commodity Insights
- Substantial drop in prices from 2027-2033 as technological improvements and easing of supply-chain constraints outpace inflationary impacts.

WIND PPA PRICE

- Prices reflect year project begins operation (3-year lag from when PPA is signed)
- Price forecasts derived using:
 - LevelTen Energy data
 - Capital cost projections from NREL and S&P Commodity Insights
- Shallow drop in prices from 2025-2033 reflect easing of supply-chain constraints outpacing inflationary impacts.

RENEWABLE PPA PRICE

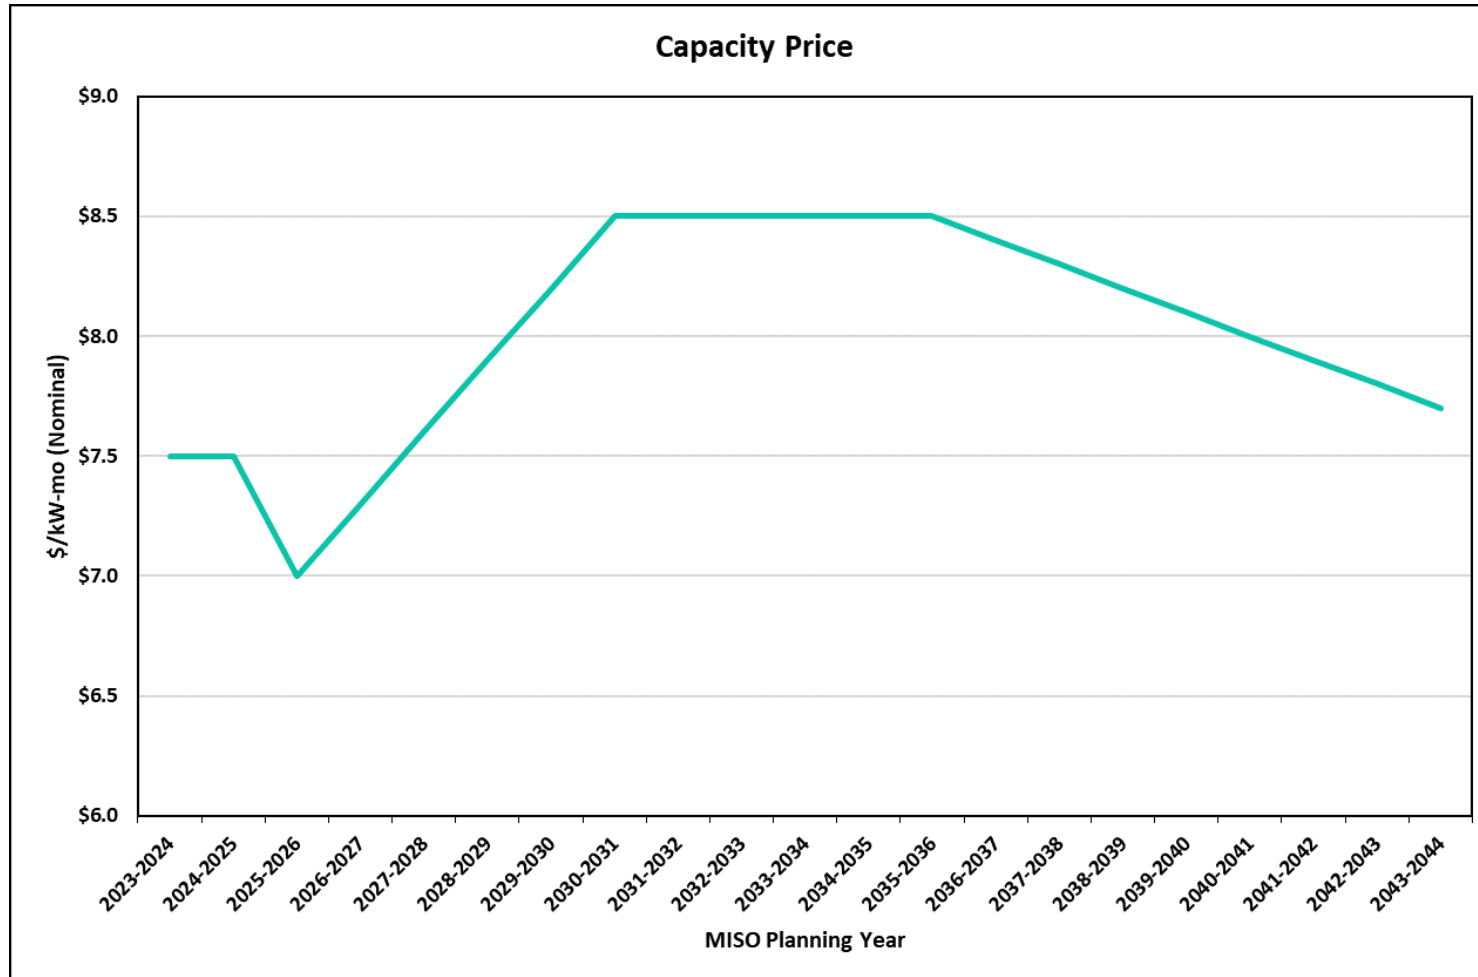

- Heavy premium in solar PPA prices relative to wind through the 2020s.
- Wind and solar PPA price forecast reaches minimums from 3023-3034 in nominal dollars.
 - In real dollars, PPA prices continue to decline through the remainder of the study.
- From the mid-2030s onward, projected wind and solar PPA prices are fairly comparable.

BATTERY STORAGE PPA PRICE

- Prices reflect year project begins operation (3-year lag from when PPA is signed)
- Price forecasts derived using:
 - PPA quotes
 - Capital cost projections from NREL and S&P Commodity Insights
- Substantial drop in prices from 2027-2033 as technological improvements and easing of supply-chain constraints outpace inflationary impacts.

BILATERAL CAPACITY PRICE

- Price shown for entire planning year.
- Assuming bilateral capacity cannot be purchased for a specific season.
- Prices reflect cost of bilateral capacity from any available resource (not specific to renewable resources).

BASE CASE RESULTS

FINANCIAL METRIC DEFINITIONS

- **Two financial metrics evaluated for this study:**
 - **Net Present Value (\$M)**
 - Cost positive
 - Includes fixed generation costs, variable generation costs, generation revenues, and load purchase costs.
 - Discount rate is applied to determine present-day value of future cash flows in 2023 dollars.
 - **Levelized Cost of Energy (\$/MWh)**
 - Net Present Value divided by discounted total load volume.

RESOURCE BUILDS/RETIREMENTS

| Solution Comparison | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|-------------------------|----|----|----|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|---------------|
| Scenario | Nameplate Capacity (MW) | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | NPV (\$M) | LCoE (\$/MWh) |
| Base | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,024 | \$60.47 |
| | Solar PPA | | | | | | | | | | | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | 20 | 25 | 25 | 30 | 30 | 35 | 40 | 40 | 45 | 45 | 50 | | |

*Bilateral capacity purchases are for one planning year.

- Dynege capacity contract and Bluegrass wind PPA expires at the end of May 2027.
- Increasing volumes of bilateral capacity are purchased during the late 2020s and from the mid-2030s onward to meet capacity requirements.
- No solar, wind, or battery storage PPAs were selected in the base case.
- 2024 budget assumptions for purchase power cost are \$58.69/MWh of load (\$74.4M total).
 - Purchase power cost includes energy charges, capacity charges, and market purchase costs.

LOAD/FIRM CAPACITY BALANCE - SUMMER

- Firm capacity requirements for summer met using bilateral capacity.

LOAD/FIRM CAPACITY BALANCE - WINTER

- Firm capacity requirements for winter met using bilateral capacity.
- Winter capacity not as much of a concern as summer until the mid-2030s.

ALTERNATE CASE RESULTS

ALTERNATE CASE 1 – 100% RENEWABLE NO RECS

| Solution Comparison | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|-------------------------|----|----|----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|----|----|------|-----------|---------------|--|
| Scenario | Nameplate Capacity (MW) | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | NPV (\$M) | LCoE (\$/MWh) | |
| Base | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,024 | \$60.47 | |
| | Solar PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | 20 | 25 | 25 | 30 | 30 | 35 | 40 | 40 | 45 | 45 | 50 | | | |
| 100% Renewable | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,193 | \$70.46 | |
| | Solar PPA | | | | | | 50 | 150 | 50 | | | | | | 50 | | | | | 50 | 100 | | | |
| | Wind PPA | | | | -6 | 150 | 100 | | | | | | | | | | | | | | -100 | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | | | | | | | | | | | | | | | | | | | |

*Bilateral capacity purchases are for one planning year.

- Model invests heavily in wind (250 MW) and solar (250MW) PPAs during the late 2020s – early 2030s to ensure 100% renewable requirements are met.
- Bilateral capacity is not needed in this scenario since capacity requirements are being met with existing resources and the renewable PPAs.
- \$169M increase in net present value when compared to the base case.

ALTERNATE CASE 2 – 100% RENEWABLE WITH RECS

| Solution Comparison | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------------|-------------------------|----|----|----|-----|----|----|----|----|----|-----|----|----|----|----|----|----|----|----|----|----|-----------|---------------|
| Scenario | Nameplate Capacity (MW) | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | NPV (\$M) | LCoE (\$/MWh) |
| Base | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,024 | \$60.47 |
| | Solar PPA | | | | | | | | | | | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | 20 | 25 | 25 | 30 | 30 | 35 | 40 | 40 | 45 | 45 | 50 | | |
| 100% Renewable - With RECs | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,054 | \$62.22 |
| | Solar PPA | | | | | | | | | | 100 | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | | 5 | 5 | 10 | 15 | 15 | 20 | 25 | 25 | 30 | 30 | | |

*Bilateral capacity purchases are for one planning year.

- Model invests in solar PPAs during early 2033 to help meet the 100% renewable requirement along with summer capacity needs.
- Bilateral capacity is added intermittently.
- \$30M increase in net present value when compared to the base case.

COST DIFFERENCE – ALT CASES 1-2

- Substantial cost increases in alternate case 1 due to lower revenues from solar PPAs.
 - Power price congestion assumed to increase over time as more solar/wind is added onto MISO's system.
- REC price is constant through forecast duration, making alt case 2 cost increase relatively flat over time.

ALTERNATE CASE 3 – 100% RENEWABLE DIVEST COAL

| Solution Comparison | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------------|-------------------------|----|----|----|-----|-----|-----|------|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----------|---------------|--|
| Scenario | Nameplate Capacity (MW) | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | NPV (\$M) | LCoE (\$/MWh) | |
| Base | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,024 | \$60.47 | |
| | Solar PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | 20 | 25 | 25 | 30 | 30 | 35 | 40 | 40 | 45 | 45 | 50 | | | |
| 100% Renewable - Divest Coal | Existing Thermal | | | | | | | -137 | | | | | | | | | | | | | | \$1,637 | \$96.69 | |
| | Solar PPA | | | | | | 50 | 150 | 50 | 50 | | | | | | | | | | 100 | 150 | | | |
| | Wind PPA | | | | -6 | 150 | 100 | | | | | | | | | | | | | | -150 | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 25 | 50 | 45 | 50 | 45 | 45 | 50 | 60 | 65 | 70 | 70 | 75 | 80 | 70 | 65 | | | |

*Bilateral capacity purchases are for one planning year.

- Model invests heavily in wind (250 MW) and solar (250MW) PPAs during the late 2020s – early 2030s to ensure 100% renewable requirements are met.
 - Additional bilateral capacity needed to ensure CMWL is meeting capacity requirements.
- \$613M increase in net present value when compared to the base case.
 - Heavily impacted by \$726M assumed cost of divestiture for Iatan and Prairie State contracts in 2030.

ALTERNATE CASE 4 – 100% RENEWABLE DIVEST COAL AND NATURAL GAS

| Solution Comparison | | | | | | | | | | | | | | | | | | | | | | | | |
|--|-------------------------|----|----|----|-----|-----|-----|------|----|----|----|-----|------|-----|-----|-----|-----|-----|-----|-----|-----|-----------|---------------|------|
| Scenario | Nameplate Capacity (MW) | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | NPV (\$M) | LCoE (\$/MWh) | |
| Base | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,024 | \$60.47 | |
| | Solar PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | 20 | 25 | 25 | 30 | 30 | 35 | 40 | 40 | 45 | 45 | 50 | | | |
| 100% Renewable - Divest Coal & Natural Gas | Existing Thermal | | | | | | | -137 | | | | | -191 | | | | | | | | | \$1,747 | \$103.15 | |
| | Solar PPA | | | | | | 50 | 150 | 50 | | | | 50 | | | | | | | | 100 | | | 150 |
| | Wind PPA | | | | -6 | 150 | 100 | | | | | | | | | | | | | | | | | -150 |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 25 | 50 | 45 | 50 | 55 | 195 | 210 | 220 | 220 | 225 | 230 | 235 | 235 | 225 | 220 | | | |

*Bilateral capacity purchases are for one planning year.

- Model invests heavily in wind (250 MW) and solar (250MW) PPAs during the late 2020s – early 2030s to ensure 100% renewable requirements are met.
 - Additional bilateral capacity needed to ensure CMWL is meeting capacity requirements.
- \$723M increase in net present value when compared to the base case.
 - Heavily impacted by \$726M assumed cost of divestiture for Iatan and Prairie State contracts in 2030 and \$90M transmission upgrade cost needed to retire local gas units.

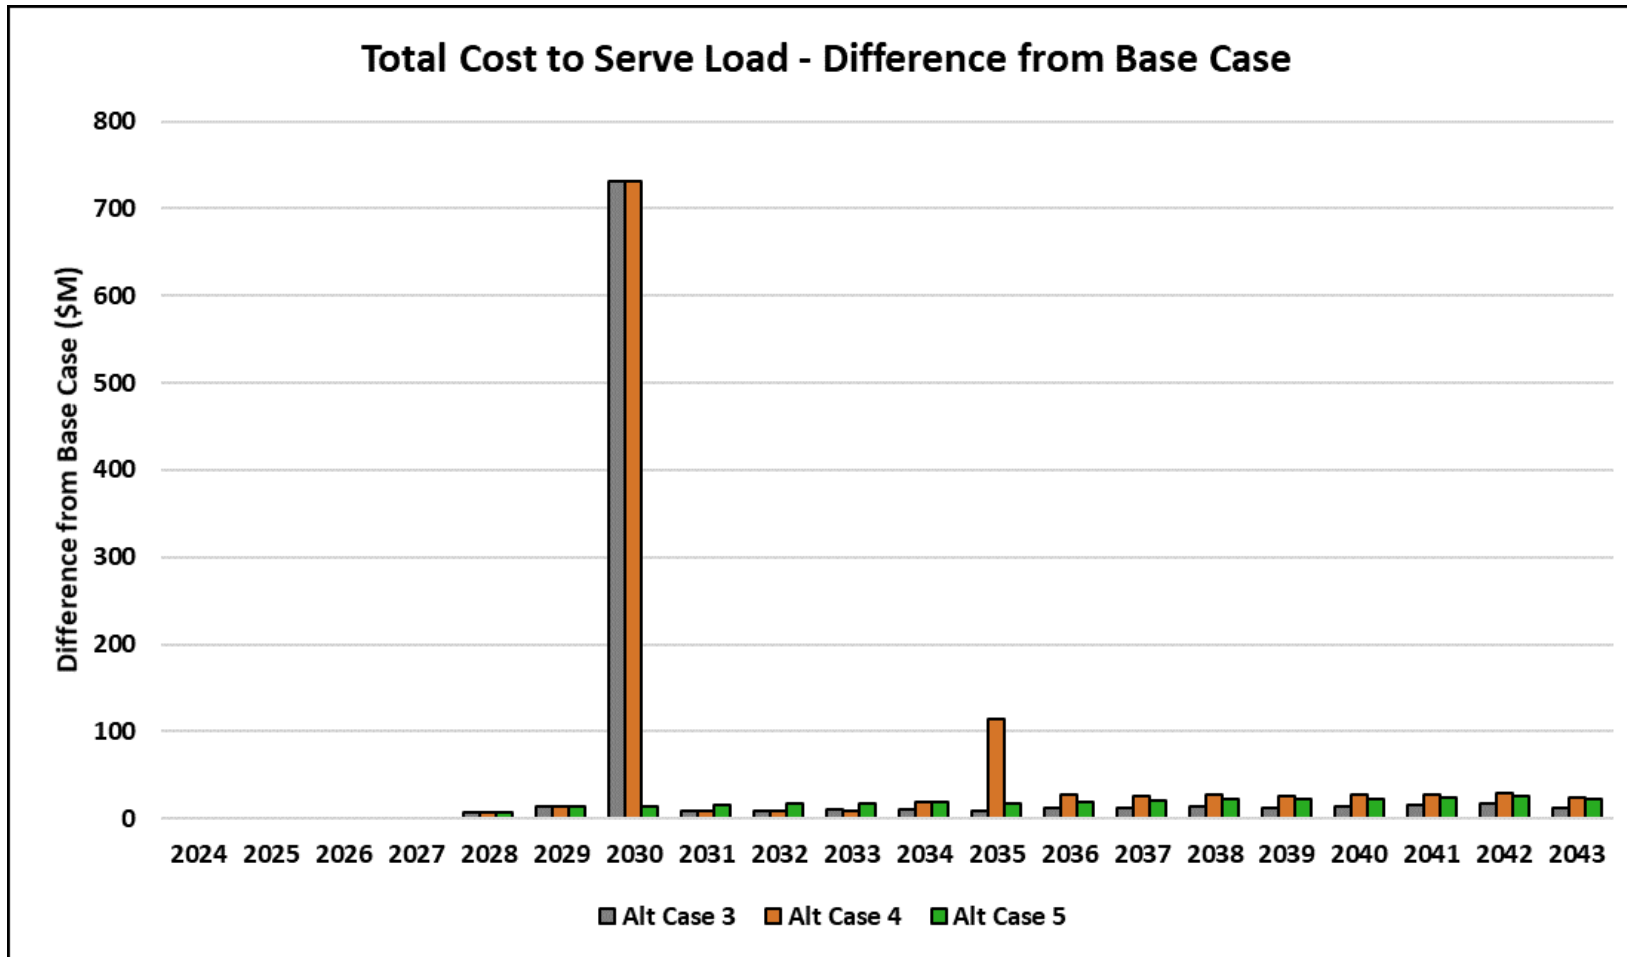

ALTERNATE CASE 5 – 100% RENEWABLE RETIRE SIKESTON EARLY

| Solution Comparison | | | | | | | | | | | | | | | | | | | | | | | | |
|--|-------------------------|----|----|----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|----|----|------|-----------|---------------|--|
| Scenario | Nameplate Capacity (MW) | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | NPV (\$M) | LCoE (\$/MWh) | |
| Base | Existing Thermal | | | | | | | | | | | | | | | | | | | | | \$1,024 | \$60.47 | |
| | Solar PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Wind PPA | | | | -6 | | | | | | | | | | | | | | | | | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 10 | 10 | 15 | 15 | 20 | 20 | 25 | 25 | 30 | 30 | 35 | 40 | 40 | 45 | 45 | 50 | | | |
| 100% Renewable - Retire Sikeston in 2028 | Existing Thermal | | | | | -66 | | | | | | | | | | | | | | | | \$1,181 | \$69.81 | |
| | Solar PPA | | | | | | 50 | 150 | 50 | | | | | | 50 | | | | | 50 | 50 | | | |
| | Wind PPA | | | | -6 | 150 | 100 | | | | | | | | | | | | | | -100 | | | |
| | Battery Storage PPA | | | | | | | | | | | | | | | | | | | | | | | |
| | Bilateral Capacity | | | | -40 | 45 | 15 | | | | | | | 5 | 5 | 5 | 5 | 10 | 15 | 15 | 5 | | | |

*Bilateral capacity purchases are for one planning year.

- Model invests heavily in wind (250 MW) and solar (250MW) PPAs during the late 2020s – early 2030s to ensure 100% renewable requirements are met.
 - Additional bilateral capacity needed to ensure CMWL is meeting capacity requirements.
- \$157M increase in net present value when compared to the base case.

COST DIFFERENCE – ALT CASES 3-5

- High cost increases during 2030 and 2035 in scenarios involving coal contract divestiture and natural gas unit retirements.

COST DIFFERENCE – ALT CASES 3-5

- High cost increases during 2030 and 2035 in scenarios involving coal contract divestiture and natural gas unit retirements.
- Outside of 2030, alt case 5 has higher annual costs than alt case 3.
 - Coal resources have higher costs than revenues, particularly in the later years.
 - CMWL has a substantial amount of excess firm capacity in alt case 5.

SCENARIO COMPARISON

- Bilateral capacity represents the largest annual bilateral capacity purchase volume during the 20-year study period.
- REC volume shown represents the maximum annual purchase volume divided by the number of hours in a year.

MAIN TAKEAWAYS

- **Largest financial impact to Columbia in achieving 100% renewable is if existing thermal resources are retired early.**
 - Additional risks present if thermal resource retirements are not approved by MISO.
- **Retirement of existing thermal resources results in substantial bilateral capacity purchases.**
 - Bilateral capacity assumed to be purchased from any available resource, purchasing strictly from renewable resources would likely result in increased costs.
- **There is value in setting incremental renewable goals rather than a single goal at a specified year.**
 - Renewable PPA prices are changing over time, this presents a risk when investing in a large volume of PPAs in just one year.
- **Additional risks associated with loss of local generation in extreme weather events were not evaluated in this study.**
 - Congestion rights costs and ancillary services not considered in this study.
- **Assumed transmission upgrades in alternate case 4 to be complete by 2035 is improbable.**
 - Transmission upgrade cost is an estimate, further evaluation required for reliability impacts and definite costs.
